

SdCvP-X™: Electronic (Design) Verification Automation Tool

VERIPOINT TECHNOLOGIES PVT LTD

AI Tools & Solutions Powering Semiconductors and Beyond

Company Profile

Veripoint Technologies is a deep-tech product company addressing critical industry challenges, from automating semiconductor verification to delivering scalable, intelligent automation for industrial sectors through its AI-powered tools and engineering solutions.

Industry Challenges

- **Semiconductors:** Manual verification slows development and increases the risk of costly silicon failures.
- **Industrial Sectors:** Scalable, intelligent automation solutions are still limited, hindering operations, efficiency and innovation.

Solutions: Our Flagship Products & Premium DV Services

- **SdCvP-X™** : Proprietary AI-driven Electronic Design Verification Automation Tool.
- **AI-driven solutions** for manufacturing, automotive, telecommunications, healthcare and more.
- **Premium DV services** delivered by a team of experts with deep specialization in verifying complex designs.

Founded: Feb 2022 | **HQ:** Noida, UP, India | **Website:** www.veripointtech.com | **DPIIT:** DIPP158213

SdCvP-X™: Electronic (Design) Verification Automation Tool

SdCvP-X™ is our proprietary AI tool that automates chip design verification, accelerating development and ensuring thorough verification.

Target Designs

- IP (standard & custom), SoC, and Subsystem

Specification (Design)

Benchmarks

- High-speed and standard Interfaces like PCIe, CXL, NVMe, Ethernet, UCIe, Display, ARINC
- Custom, Automotive & Networking chip interfaces
- Custom Analog IPs & Systems

Key Features

- **Auto-generates** features, tests, assertions, and coverage plans from specifications in various formats including **IP-XACT XML**
- **Auto-generates** UVM - Sequence, Driver, Test and SystemVerilog Assertions with custom format options
- **Dynamically adapts** to evolving specifications and syncs with manual plans
- **Auto-embeds** debug data for faster root-cause analysis
- **Integrates** with existing verification flows via Vplan for leading EDA tools

SdCvP-X™: Verification Automation Workflow

SdCvP-X™: Verifying Complex Designs

Verification Challenges	SdCvP-X™ Tool
Manual & fragmented planning, tests and assertions gaps	Auto-generates spec-aligned verification plans, UVM - Sequence, Driver, Test and SystemVerilog Assertions for Digital (IP, SoC, Subsystem) and Analog designs, directly from specifications including IP-XACT
Specification Alignment	Plan evolves with specification + Version traceability
Manual Plan Alignment with Specification and upgrades	Aligns manual plans to eliminate gaps and ensure consistency and boost productivity.
Debug Inefficiencies	Traceability matrix + mapping to features/test points
Configuration Explosion	Smart filtering, collapsing, and prioritization
Reuse across derivatives	Scalable planning across standard & custom designs

Unlike EDA simulators (VCS/Xcelium/Quest) that run testbenches, SdCvP-X automatically creates spec-aligned executable verification content, reducing manual effort by 50-60% and accelerating development by 30-40%.

Who Benefits: Across the Project Hierarchy

Role	Pain Point	SdCvP-X™ Benefit
DV Engineers	Long debug cycles, manual test list creation	Faster test planning + comprehensive tests and assertions + structured debug : Boosts Productivity
Architects	Hard to validate spec implementation	Full traceability from spec to test
Program/Project Managers	Poor visibility on verification progress	Actionable insights, milestone-based views
Business Leaders & Industries	Risk of re-spin, time-to-market delays	Higher First Silicon Success, faster Time to market

SdCvP-X™: Early Benchmarks Across Target Interfaces

Data Centre & Storage (PCIe, CXL, USB, NVMe, Ethernet IPs & Subsystems)

- Achieved *up to ~60% reduction* in verification planning and execution effort by auto-generating test, coverage, and assertion plans directly from specifications, ensuring spec-alignment.
- Achieved ~50% faster testbench readiness by auto-generating UVM sequences, drivers, and assertions directly from evolving specs.

Automotive & Networking (UCIe, DisplayPort, ARINC, Automotive/Networking IPs, Subsystems & SoCs)

- Achieved ~40% reduction in rework effort by auto-syncing evolving specifications with verification plans, ensuring consistent traceability across derivatives.
- Achieved ~40% faster verification ramp-up by reusing auto-generated verification features across protocol variants.

Mixed-Signal & Custom Systems (Custom Analog IPs & Mixed Systems)

- Achieved ~40% reduction in planning iterations by auto-aligning specifications with tests and assertions for analog and mixed-signal designs.

SdCvP-X™: GUI & OUTPUT for CXL 3.1 IP (Eval) Interface
